

Package: sanitizers (via r-universe)

September 19, 2024

Type Package

Title C/C++ Source Code to Trigger Address and Undefined Behaviour Sanitizers

Version 0.1.1

Date 2023-06-11

Author Dirk Eddelbuettel

Maintainer Dirk Eddelbuettel <edd@debian.org>

Description Recent gcc and clang compiler versions provide functionality to test for memory violations and other undefined behaviour; this is often referred to as ``Address Sanitizer" (or 'ASAN') and ``Undefined Behaviour Sanitizer" ('UBSAN'). The Writing R Extension manual describes this in some detail in Section 4.3 title ``Checking Memory Access".

This feature has to be enabled in the corresponding binary, eg in R, which is somewhat involved as it also required a current compiler toolchain which is not yet widely available, or in the case of Windows, not available at all (via the common Rtools mechanism).

As an alternative, pre-built Docker containers such as the Rocker container 'r-devel-san' or the multi-purpose container 'r-debug' can be used.

This package then provides a means of testing the compiler setup as the known code failures provides in the sample code here should be detected correctly, whereas a default build of R will let the package pass.

The code samples are based on the examples from the Address Sanitizer Wiki at <<https://github.com/google/sanitizers/wiki>>.
